

Abstract of the Disclosure

[00117] A method, apparatus, and program for monitoring an object of a system and validating the status of the object are provided. The invention can be implemented in numerous ways, including as a system (including a computer processing system), a method (including a computerized method), an apparatus, a computer readable medium, a computer program product, or a data structure tangibly fixed in a computer readable memory. Specifically, the invention provides methods and code devices for automated event processing to validate the status of an event of a monitored object in a network without manual operator intervention, including validation and remediation features based on event class.
